

Mobile Web App

The mobile web app can be used on Android phones, iPhones, iPads and other tablets by any member of your field staff to document single item events, daily visits, and even complex nursing notes. Caregivers can easily view their scheduled visits, assigned care plan tasks (before starting a visit), verify time and attendance, and capture caregiver and patient signatures.

Options

The mobile web app can be used simultaneously by some of your caregivers while others use traditional telephony, or it can be used as your organization's sole documentation tool.

The road to mobile freedom starts here.

Multiple Scenarios

The mobile web app is the perfect fit for home care, staffing, hospice and assisted living visits. When caregivers are tending to multiple clients during a shift or need to document events such as medication reminders, the mobile web app offers quick and precise documentation.

Electronic Visit Verification

The mobile web app can be used to verify time and attendance and collect all documentation items even if the caregiver is in a disconnected location. The data will sync once the caregiver's device is back in a connected location.
